This is a Brief Online Learning Tutorial (or BOLT) brought to you by the LISTEN project, a HRSA-funded project focused on improving the information literacy competencies of nursing students and professional nurses.
PubMed is available online at no cost. What if you are searching for clinical information in different settings? In any setting, if the internet can be accessed, PubMed will be available. To find reliable levels of evidence and identify relevant research effectively, it is important to recognize the various displays and formats of PubMed, so that you are able to utilize the database efficiently.
There are several commonly used display formats or settings in PubMed such as Summary, Abstract, and MEDLINE. If you don’t specify a display format PubMed will select Summary (by default) for your search results. An exception to this is results for a single citation, which displays the Abstract format. The most commonly used display formats are Summary, Abstract, and MEDLINE.
Here is a PubMed search results page. This visual shows the default display for the Summary format when your search results include multiple references.
To select other display formats, after clicking the “Display Settings”, you will see a list of available PubMed formats. The most commonly used formats are Summary, Abstract, and MEDLINE. Simply select the corresponding display format button you wish to use, and then click “apply”.
Summary is the initial PubMed display format when you have more than one search result. The summary format has a brief citation of the search results including article title with a link to a more detailed citation. The summary information includes; author or authors, journal in which the article was published, publication year, volume and issue number, page number, electronic publication date, and publication type. A PubMed ID number is also included. The article in this visual representation was already indexed in MEDLINE. A “Related Articles” hyperlink provides access to other articles that are similar to the one under examination. Use the summary display format if you want to quickly identify resources you need based on article titles.
2. Display Format: Abstract (1)

A telehealth nursing intervention reduces hospitalizations in children with complex health conditions.

Department of Laboratory Medicine and Pathology, Division of Health Informatics, University of Minnesota Department of Pediatrics.

The telehealth intervention was implemented to improve care coordination and reduce hospitalizations for children with complex health conditions. The intervention involved regular telemedicine visits with a registered nurse who monitored the child's health status and provided guidance to the child's caregivers. The intervention was effective in reducing hospitalizations and improving patient outcomes. The study was conducted over a period of two years and involved 100 children with complex health conditions. The results showed a significant decrease in hospitalizations for children who received the intervention compared to those who did not. The intervention was well-received by caregivers and children, and was found to be cost-effective. The study was funded by a grant from the National Institute of Health and was published in the Journal of Pediatrics. You can access the full article by clicking on the link provided.
Other information available in the abstract display format includes MeSH terms applicable to that resource. MeSH stands for Medical Subject Headings based on which PubMed/Medline articles were indexed. MeSH terms can help you identify standard search terms.
This graphic shows what the MEDLINE display format looks like. It is a two-character tagged field format for the complete record. Use this format to export citations into reference management programs such as EndNote, Reference Manager, and ProCite.
Two other format options deserve attention. They are useful formats when you wish to print a display. The summary text display format, and the abstract text display format each have the features of their related displays summary display, and abstract display except they don’t include any hyper links.
